Traditional CBF VS Sequential CBF

Figure 1: Example history for Alice in traditional CBF [1]

- models **general** user preference

Traditional CBF VS Sequential CBF

Figure 1: Example history for Alice in traditional CBF [1]

- models **general** user preference
- **BUT:** User preferences **change over time!** [2]

Traditional CBF VS Sequential CBF

Figure 1: Example history for Alice in traditional CBF [1]

Figure 2: Example history for Alice in sequential CBF [1]

- models **general** user preference
- **BUT:** User preferences **change over time!** [2]

- Considers the **order** of historical interactions
- Allows the modelling of "temporary spikes" of interests, as well as the general preferences [2]

The Setting

Figure 4: The Setting, consisting of a user collection *U* and their histories *h*(*u*), a collection of learning objectives *T* and a collection of exercises *X*, which can be used to predict a ranking *R*(*u*) for a given user *u*.

CBF-HybridBERT4Rec

- $H(u) := (\{(x_i, t_j, s_k) | (x_i, t_j) \in R_{t,x}\}, \leq)$, with $s_{k-1} \leq s_k$
- $I(u) := (\{x_i | (x_i, t_j, s_k) \in H(u)\}, \leq)$
- $\overrightarrow{R_{u,t}}$: the interaction probability distribution of all items with the user u over the target item

Figure 5: CBF-HybridBERT4Rec architecture and input in the described setting

CF-HybridBERT4Rec

- $u \in N \iff d_{u,t} = d_{u_m,t} \land$
  $(x,t) \in \{(x,t) | (x,t,s_k) \in H(u)\}$, with
  $U_m \in U, U \in U, t \in T, N$ being the set of
  neighbors for target (masked) user u_m and
  learning objective t
- $\overrightarrow{R_{t,u}}$: a user-similarity probability distribution of all
 users over the target (masked) user
